

Proposed Solution Template

Date	30 September 2026
Team ID	
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Proposed Solution Template

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Incident ticket categorization at the school IT helpdesk is currently handled through manual review by IT staff. Students and teachers face delays, tickets are often misclassified or misrouted, and IT staff spend excessive time on manual sorting and reassignment. The project aims to streamline this process using ServiceNow Flow Designer automation.
2	Idea / Solution Description	Develop a ServiceNow-based automated classification workflow for school IT incident requests. When a student or teacher submits a ticket, Flow Designer analyzes keywords in the short description and description fields (e.g., Wi-Fi, projector, password, slow PC), automatically tags the correct Category/Subcategory, sets Priority, routes the ticket to the appropriate IT Support group, and sends real-time status notifications.
3	Novelty / Uniqueness	The solution combines keyword-driven text parsing with real-time dynamic routing and automated notification triggers inside a single ServiceNow Flow Designer workflow. It eliminates manual initial review, ensures instant ticket assignment, and standardizes categorization without requiring third-party software.
4	Social Impact / Customer Satisfaction	Students and teachers get immediate feedback, transparent status tracking, and faster issue resolution, minimizing disruption to classes and study time. IT support staff spend far less time on repetitive ticket triaging and can focus directly on resolving technical problems.
5	Business Model (Revenue Model)	For an educational institution or enterprise, the solution reduces operational helpdesk costs, lowers mean time to resolution (MTTR), and optimizes IT staff resource allocation. As an ITSM workflow enhancement, it can be implemented as part of a ServiceNow IT Operations/Helpdesk optimization initiative without requiring separate consumer software licensing.
6	Scalability of the Solution	The workflow can scale to handle thousands of daily tickets and expand beyond basic IT issues to hardware replacement, software installation, lab equipment maintenance, and administrative requests. Additional keywords, complex subcategories, or machine-learning integrations (Predictive Intelligence) can be added on the ServiceNow platform.
